MOTIVATION

- Generalized Parton Distributions (GPDs) give insight into the 3D structure of hadrons
- Accessing GPDs can be done using deeply virtual vector meson production (DVMP)
 - DVMP is sensitive to higher order twist terms and chiral odd GPDs
- The 3D angular distribution can be shown from experimental results
 - Schilling-Wolf showed that Spin Density Matrix Elements (SDMEs) are parameters of the angular distributions
- In the Goloskokov-Kroll (GK) model, SDMEs are related to GPDs
 - This allows for constrictions on the theoretical calculation of GPDs

COMPASS

- Data
 - Year 2016, period 09, slot 8
- Monte Carlo
 - HepGen, Lepto
- Channel: $\mu p \longrightarrow \mu' \rho^0 X \longrightarrow \mu' \pi^+ \pi^- X$
 - Where X is the proton, and it is identified through the missing mass
 - ρ^0 decays into $\pi^+ \pi^-$
 - Initial Cut: $Q^2 > 0.8 \text{ GeV}^2$

MUON SELECTION

Incoming muon track (μ):

- first measured before the target
($Z_{\text{tgt,min.}} = -318.5 \text{ cm}$)
- track crosses the full target length
- momentum: $140 \text{ GeV}/c < p_\mu < 180 \text{ GeV}/c$
- momentum error: $\Delta p_\mu \leq 0.025 \cdot p_\mu$
- meantime: $-2 \text{ ns} < t_{\text{track}} < 2 \text{ ns}$
- hits in Beam Momentum Station (BMS): ≥ 3
- hits in Scintillation Fibre detectors (SCIFI): ≥ 2
- hits in Silicon strip detectors (SI): ≥ 3

Outgoing charged track (μ'):

- same charge as incoming muon
- rel. radiation length: $X/X_0 > 15$
- first measured before and last after SM1:
 $Z_{\text{first}} < 350 \text{ cm}$ and $Z_{\text{last}} > 350 \text{ cm}$
- track extrapolations are in the active hodoscope areas
(`PaHodoHelper::iMuPrim()`)

Vertex requirements:

- in target
 - $-318.5 \text{ cm} < Z_{\text{vtx}} < -78.5 \text{ cm}$
 - $R_{\text{vtx}} < 1.9 \text{ cm}$
 - $Y_{\text{vtx}} < 1.2 \text{ cm}$
- exactly one outgoing charged track

HADRON SELECTION

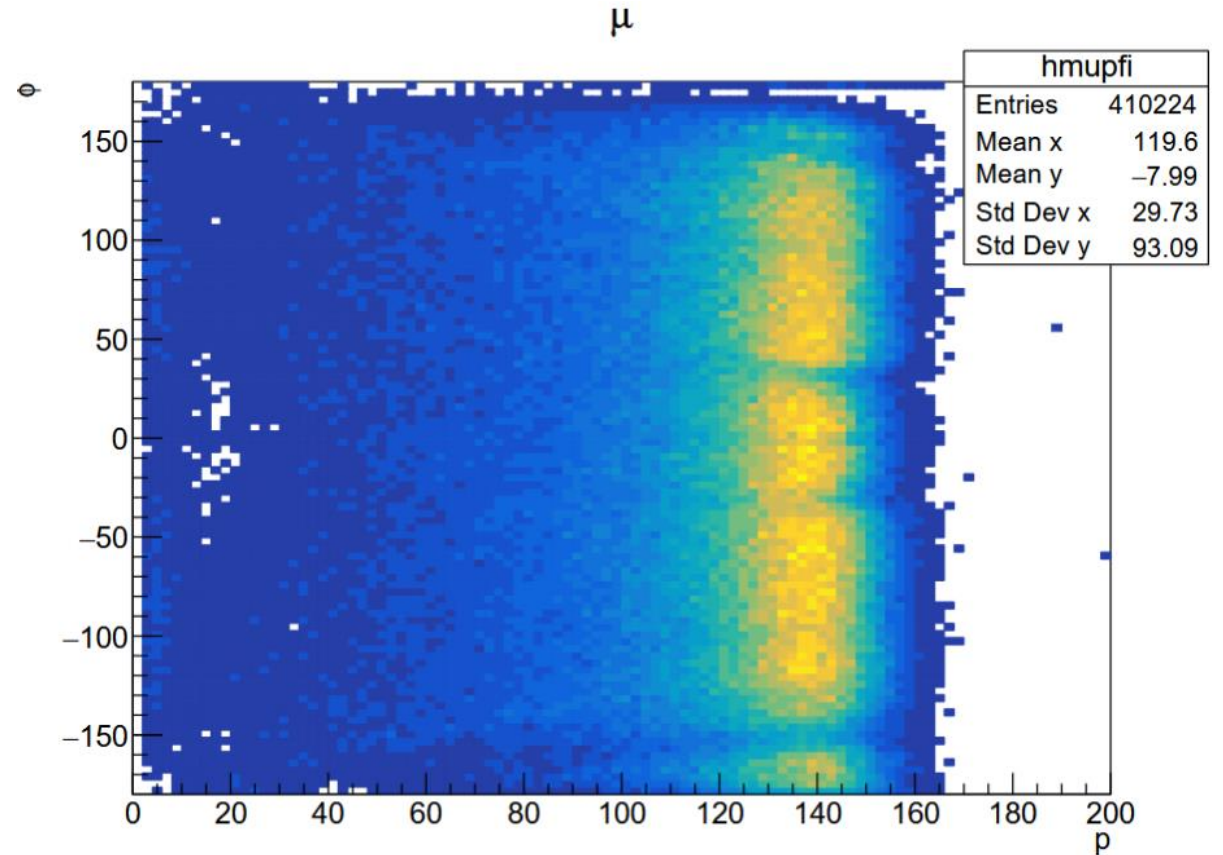

- Hadrons
 - Good fit quality of scattered hadron (π^+ , π^- reconstruction, given by reduced χ^2 is required to be smaller than 10 ($\chi^2 < 10$).
 - Track reconstruction quality $\chi^2 < 10$.
 - Penetration length of hadron track should be smaller than 10 radiation lengths.
 - Track starts before SM1, i.e. $Z_{first} < 350.0$ cm .

Proton is not identified

ANGLES FOR ANGULAR DISTRUBUTIONS

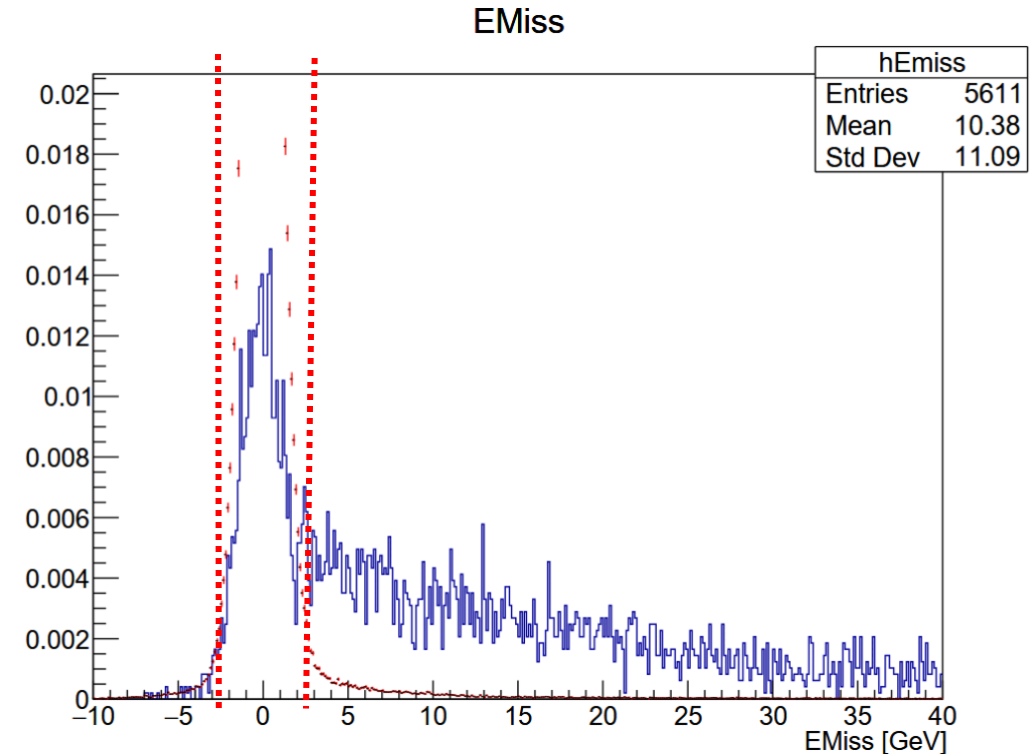

NEXT STEPS

- Showing of the comparison to the Monte Carlo and experimental data
 - Done for HepGen
 - Still need to compare lepto
- Extracting SDMEs from the angular distribution
 - Using the maximum likelihood method
 - Code is written and extraction has been attempted

$$-\ln L(\mathcal{R}) = -\sum_{i=1}^N \ln \frac{\mathcal{W}^{U+L}(\mathcal{R}; \Phi_i, \phi_i, \cos \Theta_i)}{\tilde{\mathcal{N}}(\mathcal{R})}$$
